

CD Neuron

What can you do with those free CDs you receive in the mail? Make a neuron! Drill several holes in one side of the CD. Tie lengths of wire or string through these holes. These wires or string become the dendrites of your neuron. Attach a long wire or string to the center hole of the CD (or you can drill another hole in the CD for this long wire). This long wire or string becomes the axon. Make a hole in the center of a plastic container and thread the end of the axon through it. The container becomes the synaptic terminal.

Materials:

- Rope, string or wire (for dendrites and axon)
- Plastic container (for synaptic terminal)
- CD
- Drill (to make holes in CD)

Neuron Costume

For grades K-12
